

PERSONAL BEAUTY AI · LIVE PRODUCT

BeautyScan

A personalized cosmetics platform built on skin analysis and ingredient (INCI) compatibility

Web deployed in production

Native iOS / Android

Catalog + AI ingredient analysis

PROBLEM

A long, confusing path to the right purchase

Choosing skincare turns into a chore: hours of search, reading ingredient lists and reviews — and still the wrong call.

2–3

hours per month

spent self-researching products, ingredients
and reviews

40%

ineffective purchases

products don't suit the user or fail to deliver

\$7.7B*

market size, Russia

scale of the problem = scale of the opportunity

** market figures carried over from the original deck; unsourced — to be verified before the round.*

Beauty in three steps

BeautyScan connects the full cycle — from ingredient analysis to purchase. The platform learns from your ratings and personalizes recommendations.

Not an idea — a working product on two platforms

We're past the hypothesis stage. There's a working core deployed in production and a native app ready for submission.

Web application

Next.js 15 + React 19, deployed in production (Caddy + Docker). Auth, guest mode, onboarding, scanner, product pages.

Mobile application

React Native / Expo SDK 51. Real Xcode & Gradle projects, bundle id com.skinly.mobileapp — ready for store submission.

Backend in production

Postgres + Prisma, REST API /api/v1

Compatibility engine

Deterministic, 0–100, verdict

Catalog + pipeline

Scraper → normalizer → Postgres

RU / EN i18n

300+ keys, mobile-first

The full user journey — already implemented

Every screen below runs in the current build. Drop real screenshots into this sequence.

One backend — two platforms

Web and mobile run on the same core. That lowers build cost and risk and accelerates growth.

iOS / Android

React Native · Expo SDK 51

Web (PWA-ready)

Next.js 15 · React 19

REST API /api/v1

Contract for all clients

PostgreSQL + Prisma

Catalog, profiles, history

Compatibility engine

Pure function, server+client

Auth (JWT) + Guest

bcrypt, edge middleware

Stack: Next.js 15 · React 19 · TypeScript · Prisma 6 · PostgreSQL 16 · Tailwind v4 · Expo SDK 51

Compatibility analysis that works today

A deterministic engine scores ingredients against the skin profile — no black box. An honest base for AI and ML to build on.

Working today

- INCI knowledge base: ~41 key ingredients with rules
- 9 rules: sensitivity, skin type, goals, avoid-list
- 0–100 score + verdict: excellent / good / mixed / risky
- Per-ingredient breakdown + contextual layer (time, weather)

On the roadmap

- AI explanations on top of the engine result (LLM)
- ML calibration of the score from real user ratings
- Ingredient interaction graph (retinol + AHA, etc.)

Honest framing: today this is deterministic rules, not ML. User data builds the flywheel that will train ML in the next phase.

The moat is data and self-improvement

Our innovation isn't a single algorithm — it's a system that improves as the audience grows.

Russian-sourced catalog

Pipeline from the National Catalog: scraper → normalizer → Postgres.
The code targets a ~62k-product catalog*.

Proprietary INCI base

Our own ingredient knowledge base and rules — the engine core that's hard to copy.

Network effect

Every rating sharpens recommendations — data becomes a barrier to entry.

Protecting the work

Codebase, pipeline and knowledge base are core assets; formal IP is planned.

* "62k" is the catalog target stated in code/architecture; actual DB fill needs confirmation. The original deck claimed 20K+.

COMPETITION

The only ones connecting analysis to purchase

Competitors either only assess products or only sell them. We do both — while keeping recommendations objective.

A large market and a simple growth model

TAM 50M*

cosmetics market in Russia

SAM 10M*

women 18–45, Moscow & major cities

SOM 100K–1M*

target users in year one

Monetization model

Free core

Base functionality for everyone. Monetized via affiliate commissions on sales.

Premium subscription — 299 ₽/mo

Advanced analytics, priority recommendations, exclusive content.

** market sizes from the original deck; no source stated — methodology should be confirmed before fund meetings.*

Where we are now

Execution, not promises. Much of the technical risk is already retired.

2

platforms

web in production + native app

~250

code files

two codebases, active development

9

REST endpoints

one API for mobile clients

RU/EN

localization

300+ translation keys

What's not here yet (honestly): public launch, revenue and user metrics. The round is to ship to stores and start building traction.

From a built product to market leadership

Done

- Web app in production
- Native iOS/Android app
- Backend, REST API, Postgres
- Compatibility engine v1
- Barcode scanner (web + native)
- Catalog pipeline, RU/EN

In progress

- Store submission prep
- Catalog fill & quality
- Monetization testing

Next (0-6 mo)

- Launch on App Store / Google Play
- First users and traction
- AI explanations (LLM)
- Premium subscription

Vision

- ML personalization on data
- Ingredient interaction graph
- Russian regions & expansion
- Marketplace opportunities

TEAM

A team that can execute

A balanced team that has already taken the product from zero to a deployed prototype on two platforms.

CEO / Founder

Vision, business development, product,
fundraising

CTO

Architecture, development, ML direction,
team leadership

Data analyst

Market research, user behavior, product
metrics

Core functions are covered: product, engineering and data.

Investment to reach the market

The technical foundation is built. The round funds launch, first users and staying ahead of competitors.

BeautyScan — the new standard for choosing cosmetics

A real problem solved

Turning hours of search into three simple steps to the right product

Working technology

One platform connecting ingredient analysis and personalized purchase

Execution, not an idea

A product in production on two platforms — technical risk retired

We're changing the category by making cosmetics choices informed, fast and pleasant.

Thank you. We're happy to answer your questions.
